REVIEW PROCESS

Flowchart of the syllabus review process

1. AUTHOR

- The author will create a draft of the syllabus.

2. PROGRAM REVIEW

- The syllabus draft will be reviewed by the chairperson (**or senior if the chairperson is the syllabus author**).
- The draft will then be transferred to the **dean** along with the suggestions.

3. DEAN REVIEW

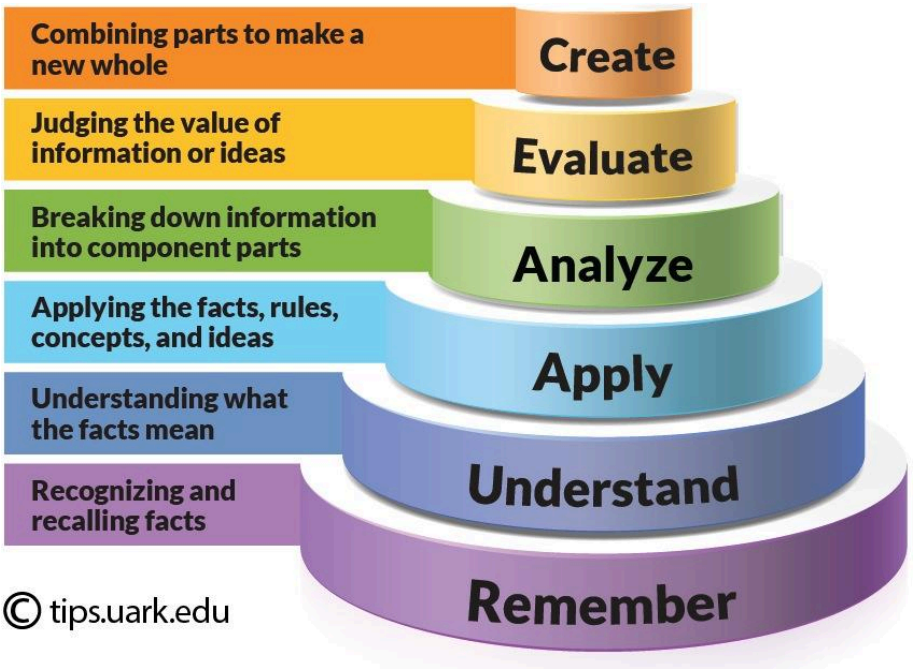

- The syllabus draft will be reviewed by the dean.
- The draft will then be transferred to the **CITL** along with the suggestions.

4. CITL REVIEW

- The syllabus draft will be reviewed by the CITL.
- The draft will then be **returned** to the **author** along with the suggestions.

5. AUTHOR REVISION
    - The author revises the syllabus draft based on the suggestions.
    - After the author created the revision, it will undergo endorsement in the following order:
        - Department Endorsement (Chairperson with countersign from Senior),
        - Dean Endorsement,
        - and CITL Endorsement.
6. OVPAA
    - The OVPAA will decide if the syllabus is endorsed (or return if there are suggestions).

BLOOM'S TAXONOMY IN SYLLABUS DEVELOPMENT

Credit: Graphic by Jessica Shabatura. For more information, visit https://tips.uark.edu/using-blooms-taxonomy/#gsc.tab=0.

INTRODUCTION TO BLOOM'S TAXONOMY

Bloom's Taxonomy is a hierarchical model used to classify educational learning objectives into levels of complexity and specificity. It provides a framework for developing instructional activities and assessments that align with desired learning outcomes.

Levels of Bloom's Taxonomy

Level	Definition	Key Verbs
Remembering	Recalling or recognizing information	define, list, name, recall, recognize, repeat
Understanding	Explaining ideas or concepts	classify, describe, discuss, explain, identify, summarize
Applying	Using information in new situations	apply, choose, demonstrate, implement, solve, use
Analyzing	Drawing connections among ideas	analyze, compare, contrast, differentiate, examine, organize
Evaluating	Justifying a stand or decision	appraise, argue, defend, judge, justify, support
Creating	Producing new or original work	compose, construct, design, develop, formulate, generate, plan

Integrating Bloom's Taxonomy into Syllabus Design

Using Bloom's Taxonomy in syllabus design helps ensure that learning objectives and assessments target a range of cognitive skills. It promotes a well-rounded educational experience by encouraging both lower-order and higher-order thinking.

Benefits of Using Bloom's Taxonomy

- Provides a clear structure for developing learning objectives.
- Ensures alignment between learning objectives, activities, and assessments.
- Promotes higher-order thinking skills among students.
- Facilitates effective assessment and evaluation of learning.Bloom's

TAXONOMY IS DIVIDED INTO TWO LEVELS

Lower-order Thinking Skills (LOTS)

These refer to the first three levels of Bloom's Taxonomy: **Remembering**, **Understanding**, and **Applying**. They involve basic cognitive processes like memorization, comprehension, and application of knowledge.

Higher-order Thinking Skills (HOTS)

These refer to the top three levels of Bloom's Taxonomy: **Analyzing**, **Evaluating**, and **Creating**. They involve more complex cognitive processes like critical thinking, problem-solving, and creativity.

Key Differences

	LOTS	HOTS
Complexity of Skills	Involves basic skills that are fundamental to learning.	More advanced skills that require deeper understanding and the ability to manipulate information.
Type of Learning	Focuses on acquiring and understanding information.	Emphasizes using information to analyze, evaluate, and create.
Level of Engagement	Often involves passive learning, like memorizing facts.	Requires active learning, where students engage with the material and construct their own understanding.
Assessment	Are typically assessed through simple recall questions or tests of comprehension.	Requires more complex assessments, like essays, projects, or presentations, where students can demonstrate their ability to analyze, evaluate, and create.

Overall, both LOTS and HOTS are essential for learning. LOTS **provide** the foundation of knowledge, while HOTS allow students to **think** critically, solve problems, and apply their knowledge in creative ways.

WHAT TO REMEMBER WHEN CREATING CO AND SLO

Alignment with Educational Goals

- Course outcomes should align with the broader educational goals of the program and institution.
- Ensure outcomes reflect the key learning objectives of the course.

Clarity and Specificity

- Use clear and concise language to write course outcomes.
- Outcomes should be specific and measurable, avoiding vague terms.

Action Verbs

- Start each outcome with an action verb that describes observable student behavior.
- Use verbs from Bloom's Taxonomy to reflect different levels of cognitive skills (e.g., define, analyze, evaluate, create).

Student-Centered Focus

- Frame outcomes from the perspective of what students will be able to do upon completion of the course.
- Focus on the skills, knowledge, and abilities students will gain.

Measurability

- Outcomes should be assessable and measurable through various means (e.g., assignments, exams, projects).
- Consider how student achievement of each outcome will be evaluated.

Coverage of Key Content

- Ensure outcomes cover the essential content and topics of the course.
- Include outcomes that address both foundational knowledge and higher-order thinking skills.

Number and Scope

- Limit the number of course outcomes to a manageable amount.
- Outcomes should be comprehensive but not overly detailed or narrow.

Review and Revision

- Regularly review and revise course outcomes to ensure they remain relevant and effective.
- Seek feedback from colleagues and students to improve outcomes.

FINAL EXAMINATION							

SPECIFIC LEARNING OUTCOME

NUMBER OF OUTCOMES

To ensure sufficient depth and breadth of learning, each course outcome must be supported by a minimum of 3 and a maximum of 5 specific learning outcomes. This range allows for adequate coverage of the course material without overwhelming students with excessive learning objectives.

TYPES OF OUTCOMES

To guide the learning process effectively, every set of specific learning outcomes must include the following types:

- **Introductory Outcome**: This outcome sets the stage for learning by introducing foundational concepts and skills. It typically involves lower-order cognitive processes, such as remembering and understanding.
- **Mediating Outcome**: Building upon the introductory outcome, this outcome focuses on developing deeper understanding and application of knowledge and skills. It often involves mid-level cognitive processes, such as applying and analyzing.
- **Finale Outcome**: This outcome represents the culmination of learning, where students demonstrate mastery of the course material by creating or evaluating something new. It typically involves higher-order cognitive processes, such as evaluating and creating.

BLOOM'S TAXONOMY AND OUTCOME LEVELS

- **Remembering (Bloom's Taxonomy)**: This cognitive process, which involves recalling or recognizing information, should ONLY be used for Introductory outcomes. This ensures that students have a basic grasp of the subject matter before moving on to more complex tasks. However, this does not mean that you must start with this cognitive process.
- **Creating (Bloom's Taxonomy)**: This cognitive process, which involves generating new ideas or products, should ONLY be used for Finale outcomes. This allows students to synthesize their learning and demonstrate their ability to apply knowledge and skills in creative ways. However, this does not mean that you must end with this cognitive process.

EXAMPLE

In our example, we have this course outcome and its corresponding specific learning outcomes:

Course Outcome

- Demonstrate content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science.

Specific Learning Outcomes

- **Explain** the key characteristics and principles that define the nature, goal, scope of science and the domains of learning in the context of science education.
- **Summarize** standards and the scope of science.
- **Compare** and contrast the conceptual underpinning of the teaching of science in K to 12 Curriculum through Graphic organizer.

On the other hand, here are the previously introduced Bloom's taxonomy:

Level	Key Verbs
Remembering	define, list, name, recall, recognize, repeat
Understanding	classify, describe, discuss, **explain**, identify, **summarize**
Applying	apply, choose, demonstrate, implement, solve, use
Analyzing	analyze, **compare**, contrast, differentiate, examine, organize
Evaluating	appraise, argue, defend, judge, justify, support
Creating	compose, construct, design, develop, formulate, generate, plan

As can bee seen we have:

Type	**Key Verbs**	**Bloom's Taxonomy Level**
Introductory	Explain	Understanding
Mediating	Summarize	Understanding
Finale	Compare	Analyzing

The next learning outcome, based on the given structure, must be **at or above** the cognitive level of the one before it. This means that the difficulty and complexity of

the expected cognitive processes should not go backward; they should either stay the same or become more challenging. This makes sure that learning progresses, and students are always pushed to work with more and more complex ideas and tasks.

COURSE OUTCOME

NUMBER OF COURSE OUTCOMES

Each course must have a minimum of 3 and a maximum of 5 course outcomes. This ensures that the course is focused on achieving a manageable number of key learning objectives while still providing sufficient depth and breadth of content.

BLOOM'S TAXONOMY AND COURSE OUTCOMES

When writing course outcomes, Bloom's Taxonomy will be used as a framework to guide the development of learning objectives that promote higher-order thinking skills. Specifically, the higher-order thinking skills of **Apply**, **Analyze**, **Evaluate**, and **Create** should be used to ensure that students are not only acquiring knowledge but also developing the ability to apply that knowledge in meaningful ways.

EXCLUSION OF LOWER-ORDER THINKING SKILLS

The lower-order thinking skills of **Remember and Understand should not be used** in course outcomes, as they are already included within the cognitive domain and do not promote higher-order thinking. While these skills are foundational for learning, they do not challenge students to think critically or creatively.

BLOOM'S TAXONOMY AND OUTCOME LEVELS

The verb **Creating**, which represents the highest cognitive level in Bloom's Taxonomy, should only be used for the final course outcome. This ensures that students have a strong foundation in the lower cognitive levels before being challenged to create new knowledge or products. However, this does not mean that you must end with this cognitive process.

EXAMPLE

In our example, we have this course outcome and its corresponding course outcomes:

- **Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science
- **Construct** effective assessment tools in teaching science
- **Design** an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities
- **Demonstrate** pedagogical and technological knowledge and skills in the teaching of science

On the other hand, here are the previously introduced Bloom's taxonomy:

Level	Key Verbs
Remembering	define, list, name, recall, recognize, repeat
Understanding	classify, describe, discuss, explain, identify, summarize
Applying	apply, choose, **demonstrate**, implement, solve, use
Analyzing	analyze, compare, contrast, differentiate, examine, organize
Evaluating	appraise, argue, defend, judge, justify, support
Creating	compose, **construct**, **design**, develop, formulate, generate, plan

As can bee seen we have:

Key Verbs	Bloom's Taxonomy Level
Demonstrate	**Applying**
Donstruct	**Creating**
Design	**Creating**
Demonstrate	**Applying**

Explanation of Apparent Cognitive Level Regression in Course Outcomes

From the example it appears that the COs are showing a regressing cognitive level:

- **Design** an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities
- **Demonstrate** pedagogical and technological knowledge and skills in the teaching of science

In the syllabus, when crafting course outcomes, it is emphasized to use higher-order thinking skills (HOTS) like Apply, Analyze, Evaluate, and Create. Specifically, it is suggested that the verb "Creating" should ideally be used for the final course outcome.

However, when examining the provided course outcomes:

- "Demonstrate content knowledge..." (Applying)
- "Construct effective assessment tools..." (Creating)
- "Design an instructional plan..." (Creating)
- "Demonstrate pedagogical and technological knowledge..." (Applying)

We observe what appears to be a regression from "Creating" back to "Applying" in the final outcome.

Why this is not necessarily a true cognitive regression:

1. **Shift in Focus**: The initial outcomes focus on creating products (assessment tools, instructional plans), which directly aligns with the "Creating" level. The final outcome shifts to demonstrating skills. This change in emphasis is crucial.
2. **Context of "Demonstrate"**: While "demonstrate" is listed under "Applying," in the context of "Demonstrate pedagogical and technological knowledge and skills," it implies more than simple application. It involves:
    - Integration: Combining various pedagogical and technological concepts.
    - Proficiency: Showing mastery and skillful execution.
    - Adaptation: Potentially adjusting skills to different teaching situations.
3. **Complexity of Demonstration**: This is not a simple recall or basic application. It's a complex performance requiring synthesis, integration, and proficient use of knowledge, which suggests a higher level of cognitive engagement than basic "Applying."

Therefore, while the verb "demonstrate" is categorized under "Applying," the specific context of demonstrating pedagogical and technological knowledge and skills involves a level of complexity that transcends simple application. This makes it less of a cognitive regression and more of a shift to demonstrating a complex set of skills, which still aligns with the document's intent of promoting higher-order thinking.

RELATIONSHIP BETWEEN CO AND SLO

Course outcomes and specific learning outcomes are interconnected and work together to guide the learning process. Course outcomes are broad statements

describing what students should be able to do by the end of a course. Specific learning outcomes are more detailed and granular, outlining the specific knowledge and skills students must acquire to achieve the broader course outcomes.

Alignment of Cognitive Levels

A crucial aspect of this relationship is the alignment of cognitive levels. Course outcomes must emphasize and be supported by specific learning outcomes. The cognitive level of each specific learning outcome should be lower than or equal to the cognitive level of its corresponding course outcome. This ensures that specific learning outcomes build up to and enable the achievement of the broader course outcomes.

Hierarchical Structure

Think of course outcomes as the overall goals and specific learning outcomes as the steps needed to reach those goals. This hierarchical structure ensures that the learning process is well-organized and that students progressively develop the necessary skills and knowledge.

Ensuring Progress

By ensuring that specific learning outcomes are at or below the cognitive level of the course outcomes, it guarantees that learning progresses logically. Students first acquire foundational knowledge and skills (lower-level cognitive processes) and then move on to more complex tasks and higher-level thinking (higher-level cognitive processes). This progression is essential for effective learning and mastery of the course material.

Example Illustration

For instance, if a course outcome requires students to "Design an instructional plan," a specific learning outcome might be to "Summarize key instructional strategies." "Summarize" is at a lower cognitive level (Understanding) than "Design" (Creating), ensuring that students first understand the basics before attempting the more complex task.

In summary, specific learning outcomes must support and be aligned with the cognitive level of course outcomes. The cognitive level of specific learning outcomes should be lower than or equal to that of the course outcomes, ensuring a logical and progressive learning experience.

EXAMPLE

In our example, we have this course outcome and its corresponding course outcomes with its corresponding specific learning outcomes:

- **Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science
    - **Explain** the key characteristics and principles that define the nature, goal, scope of science and the domains of learning in the context of science education.
    - **Summarize** standards and the scope of science.
    - **Compare and contrast** the conceptual underpinning of the teaching of science in K to 12 Curriculum through Graphic organizer.

Tip: Sometimes, a SLO might seem to be at a higher cognitive level (like Analyzing) than its CO, like Applying. This happens because "Demonstrate" (Applying) can mean more than just simple use of knowledge. It can involve complex thinking like analyzing to truly show understanding. In such cases, the "Analyzing" SLO isn't separate, but a necessary step to achieve the "Applying" CO. The context and complexity of the task matter more than just the verb used.

- **Construct** effective assessment tools in teaching science
    - **Discuss** the varied types and modes of assessment.
    - **Critique** sample test items and rubrics, identifying strengths and areas of improvement.
    - **Develop** traditional and authentic assessments tools that align with the objectives of science education in K to 12.
- **Design** an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities
    - **Discuss** the different phases in lesson planning preparation.
    - **Analyze** the alignment of the learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities utilized by a resource teacher during a class observation.
    - **Design** an engaging and inquiry-based science lessons that promote critical thinking, problem-solving, and scientific inquiry.
- **Demonstrate** pedagogical and technological knowledge and skills in the teaching of science
    - **Assess** various educational technology tools suitable for science instruction.
    - **Integrate** technology in employing varied pedagogies in the teaching of science.

Tip: Remember that "Integrate technology …" is a **Creating** outcome. This is because it requires designing and developing a new approach by combining technology and pedagogy, rather than simply applying existing knowledge.

    - **Execute** teaching by integrating technology in employing varied

pedagogies in the teaching of science.

Tip: Keep in mind that “executing a teaching …” extends beyond theory and falls under the **Creating** cognitive level. It involves practical application, adaptability, and responsiveness, resulting in a new and unique learning experience.

As can bee seen we have:

Cognitive Level	Represented Value
Remembering	1
Understanding	2
Applying	3
Analyzing	4
Evaluating	5
Creating	6

This is a cognitive level representation for your reference

Course Outcomes	Specific Learning Outcomes
Demonstrate (3)	Explain (2)
	Summarize (2)
	Compare (4)
Construct (6)	Discuss (2)
	Critique (5)
	Develop (6)
Design (6)	Discuss (2)
	Analyze (4)
	Design (6)
Demonstrate (3)	Assess (5)
	Integrate (6)
	Execute (6)

Explanation of Specific Learning Outcomes at a Higher Cognitive Level Than Course Outcomes

From the example we have the following CO and SLO:

- **Demonstrate (3)** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science
    - **Compare and contrast (4)** the conceptual underpinning of the teaching of science in K to 12 Curriculum through Graphic organizer.

While it's generally stated that specific learning outcomes (SLOs) should be at or below the cognitive level of their corresponding course outcomes (COs), there are instances where an SLO might appear to be at a higher cognitive level. This is particularly evident when a CO at the "Applying" level has an SLO at the "Analyzing" level. This apparent discrepancy can be understood by considering the nuanced relationship between COs and SLOs and the specific context in which they are used.

"Applying" as a Broad Cognitive Goal

A course outcome using the verb "Demonstrate" (typically associated with "Applying") might encompass a broader range of cognitive processes than just simple application. In the context of "Demonstrate content knowledge," it can imply:

- **Understanding**: Grasping the concepts.
- **Analyzing**: Breaking down those concepts into components and relationships.
- **Synthesizing**: Putting different aspects of knowledge together to form a coherent understanding.

Thus, "Demonstrate" in this context is not merely about using knowledge mechanically but about actively engaging with and processing the information.

"Analyzing" as a Necessary Component of "Applying"

To effectively "Demonstrate content knowledge" of a complex subject, such as the conceptual framework of teaching science, **students must be able to analyze its various aspects**. "Comparing and contrasting" (an "Analyzing" level activity) is often a crucial step in understanding and demonstrating that knowledge. In this case, the "Analyzing" SLO is not separate from the "Applying" CO but is an integral part of it.

SLOs as Steps to Achieve COs

Specific learning outcomes are the steps students take to achieve the broader course outcomes. Analyzing through comparison and contrast can be a specific step that enables students to demonstrate their overall content knowledge. The graphic organizer used in the example ("Compare and contrast the conceptual underpinning of the teaching of science in K to 12 Curriculum through Graphic organizer") serves as a tool to show this analysis and thus demonstrate the content knowledge.

Context Matters

The specific context of the verb "Demonstrate" significantly influences its cognitive demand. When "Demonstrate" implies a complex integration and skillful execution of knowledge, it justifies the inclusion of "Analyzing" SLOs as essential components of that demonstration.

Therefore, a course outcome at the "Applying" cognitive level can have a specific learning outcome at the "Analyzing" cognitive level when that analysis is a necessary and integral part of achieving the broader "Applying" outcome. The "Analyzing" SLO provides a means for students to demonstrate a deeper and more comprehensive understanding, ultimately fulfilling the requirement of the "Applying" CO.

PERFORMANCE ASSESSMENT OUTPUTS

Performance assessment outputs are tangible pieces of evidence that demonstrate a student's ability to apply knowledge and skills in a practical setting. These outputs serve as a means to evaluate whether specific learning outcomes and course objectives have been met. Below is a table outlining potential performance assessment outputs related to science education.

Course Outcomes	Performance Assessment Outputs
Demonstrate content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science	Graphic Organizer
Construct effective assessment tools in teaching science	Unit/Chapter Test Tests and Rubrics
Design an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities	Instructional Plan of a chosen topic in Science
Demonstrate pedagogical and technological knowledge and skills in the teaching of science	Teaching Demonstration

Performance assessment outcomes are direct, tangible evidence that students have achieved the course outcomes. Course outcomes state what students should know or be able to do by the end of the course, while performance assessment outcomes demonstrate that students have actually met those expectations. Essentially, performance assessment outcomes are the proof that learning has taken place and that the course outcomes have been fulfilled.

Determining Compatibility of Performance Assessment Outcomes

To determine if a performance assessment outcome is compatible with a course outcome, consider the following:

1. **Direct Alignment**: The performance assessment outcome should directly reflect the skills or knowledge stated in the course outcome. If the course outcome states "Design an instructional plan," then a compatible performance assessment output would be an "Instructional Plan of a chosen topic in Science."
2. **Measurability**: The performance assessment outcome should be something that can be objectively measured or evaluated. It should produce a tangible piece of work or a demonstrable skill that can be assessed against clear criteria.
3. **Demonstration of Skills**: The performance assessment outcome should require students to actively demonstrate the skills or knowledge outlined in the course outcome, not just recall information. It should involve application, creation, or analysis.
4. **Level of Cognitive Complexity**: The cognitive level required for the performance assessment outcome should match or be slightly higher than the cognitive level of the course outcome. For instance, if a course outcome requires "Applying" knowledge, the performance assessment outcome should require applying that knowledge in a practical way.
5. **Evidence of Learning**: The performance assessment outcome should provide clear evidence that the student has achieved the specific learning outcomes that support the course outcome. It should show that the student has understood, applied, and potentially analyzed or created something related to the course content.

Incompatible performance assessment outcomes might include:

- **Simple recall tests** when the course outcome requires higher-order thinking skills.
- **Vague or subjective tasks** that don't provide clear evidence of learning.
- **Tasks that don't directly relate** to the stated course outcomes.

By ensuring that performance assessment outcomes are directly aligned, measurable, and require a demonstration of skills at the appropriate cognitive level, you can confirm their compatibility with the course outcomes.

INNOVATIVE APPROACHES AND STRATEGIES

Approach	Teaching Strategies

Constructivist Approach	Problem-Based Learning
	Collaborative Projects
	Interactive Simulations
Behaviorist Approach	Token Economics
	Gamification
	Drill
Cognitive Approach	Socratic Questioning
	Devil's Advocate
	Metacognitive Strategies
	Guided Discovery
	Brainstorming
	Interactive Lecture
	Design Thinking
Social Learning Approach	Modeling
	Cooperative Learning Strategies
	Peer Teaching or Peer Review or Pair Peer Review
Inquiry-Based Approach	Guided Inquiry
	Science Experiments
	Field Studies
	Case-Based Learning
	Debate Teams or Walking Debate
	Visual Displays
	Gallery Walk/Run
	Computer Tour
	Project-Based Learning
Experiential Learning Approach	Internship

	Simulations
	Virtual and Site Visits
	Service Learning
	Hands-On Activities
	Virtual Labs (VLab)
Connectivist Approach	Online Learning Communities or Collaborative Learning Spaces
	Social Media Projects
	Webinars and Online Conferences
	Networked Learning Projects
	Flipped Classroom

ICT TOOLS/RESOURCES

Here is a table outlining potential ICT tools and resources that can be used in syllabus development and implementation:

Tool/Resource Category	Specific Examples	Purpose/Application
Collaboration Tools	Google Classroom, Microsoft Teams, Slack, Zoom, Google Docs, Google Sheets, Google Slides, Miro	Facilitate collaborative work on syllabus drafts, provide platforms for communication and feedback, enable real-time editing and sharing of documents, support virtual meetings and discussions, allow for visual collaboration and brainstorming.
Productivity Tools	Microsoft Office Suite (Word, Excel, PowerPoint), Google Workspace (Docs, Sheets, Slides), Notion, Trello, Asana	Assist in creating, organizing, and storing syllabus content, manage tasks and timelines for syllabus development, track revisions and feedback, support the creation of presentations and reports, organize information and workflows.

Tool/Resource Category	Specific Examples	Purpose/Application
Educational Software	Google Classroom, Canvas, Blackboard; Online assessment tools (e.g., Quizizz, Kahoot!), Interactive whiteboards (e.g., Jamboard)	Provide platforms for delivering syllabus content to students, manage assignments and assessments, enable online quizzes and interactive learning activities, facilitate real-time collaboration and visualization, support blended learning approaches, provide data and analytics on student progress.
Digital Libraries	JSTOR, Project Gutenberg, Open Access repositories, University library databases	Provide access to research articles, academic journals, books, and other resources that can inform syllabus content, support the inclusion of relevant readings and materials in the syllabus.
Web Conferencing	Zoom, Google Meet, Microsoft Teams, Webex	Conduct virtual meetings for syllabus review, facilitate online office hours, support remote teaching and learning, enable guest lectures and presentations.
Video Creation Tools	Screencast-O-Matic, Loom, OBS Studio	Create video tutorials and explanations of syllabus content, record lectures and presentations, provide asynchronous learning opportunities, support flipped classroom models.
Cloud Storage	Google Drive, Dropbox, OneDrive	Store and share syllabus documents, provide access to resources and materials from any location, ensure document backup and version control.

STEP-BY-STEP GUIDE TO CREATING A SYLLABUS

Step 1: Define Course Information

- Course Title
- Course Code
- Nominal Duration
- Prerequisite
- Course Description (Brief overview of what the course covers)

Step 2: Establish Learning Objectives

- What should students know or be able to do by the end of the course?
- Write clear, measurable, and achievable learning objectives.
- Align objectives with course content and assessments.

Step 3: Determine Assessment Methods

- How will student learning be assessed? (Exams, quizzes, papers, projects, participation)

Step 4: Set Teaching Approach and Strategy

- Select the teaching approach and strategies that will be employed in the course.
- Ensure alignment with the learning objectives and assessment methods.

Step 5: List ICT Tools/resources

- Explain the grading scale (A, B, C, etc.).
- Describe policies on late submissions, make-up exams, and attendance.
- Outline any extra credit opportunities.

Step 6: List Required Materials

- List textbooks, readings, software, or other materials students need.
- Provide information on where to obtain these materials.

Step 7: Review and Revise

- Review the syllabus for clarity, consistency, and accuracy.
- Get feedback from colleagues or other instructors.
- Make revisions as needed before distributing to students.

Step 8: Be Flexible and Adaptable

- Be prepared to make adjustments to the syllabus as needed during the semester.
- Communicate any changes to students clearly and promptly.

STEP 1: DEFINE COURSE INFORMATION

- Course Title
- Course Code
- Nominal Duration
- Prerequisite
- Course Description (Brief overview of what the course covers)

This step focuses on establishing the foundational details of your course. It's crucial to clearly outline these elements before proceeding with further syllabus development.

Course Code: EL 114

Course Title: Survey of the Afro-Asian Literature

Course Credit: 3 units

Nominal Duration: 54 hours

Prerequisite: EL 111

Description

The course description should be comprehensive and incorporate several key elements to provide students with a clear understanding of the course's expectations and objectives. It must include:

- Policy Standard Guidelines: The course description must align with and explicitly reference relevant policy standard guidelines, such as CMO No. 75 S. 2017, to ensure that the course adheres to established educational standards and requirements.
- End Goal of the Course: A clear and detailed articulation of the end goal of the course is essential. These outcomes should specify the knowledge, skills, and competencies that students are expected to acquire upon successful completion of the course.
- Teaching Methods: The course description should outline the pedagogical approaches and instructional strategies that will be employed to facilitate student learning. This may include lectures, discussions, seminars, case studies, group work, or other relevant methods.
- Context: Providing the context of the course helps students understand its relevance and significance within the broader academic discipline or field of study. This may involve situating the course within a historical, theoretical, or practical framework.

- Output: The course description should clearly state the expected output or deliverables that students will be required to produce to demonstrate their mastery of the course material. This may include assignments, essays, projects, presentations, or other forms of assessment.

For policy standard guidelines please refer to: https://ched.gov.ph/issuances/

Description: This course deals with the goals, materials, content, assessment, management and methods of teaching science at the secondary level. Further, this provides opportunities for class observation and demonstration teaching. This provides an exploration of the K to 12 science curriculum, emphasizing its foundational principles and practical application. Students will develop the ability to create meaningful assessments, design comprehensive instructional plans that integrate diverse teaching strategies and resources, and effectively utilize pedagogical and technological tools. Through various innovative strategies and approaches, the students will gain the skills necessary to foster scientific inquiry and critical thinking in diverse learning environments. The course culminates in practical experiences through classroom demonstration teaching, allowing students to refine their instructional approaches and translate theoretical knowledge into real-world practice.

STEP 2: ESTABLISH LEARNING OBJECTIVES

- What should students know or be able to do by the end of the course?
- Write clear, measurable, and achievable learning objectives.
- Align objectives with course content and assessments.

Bad Examples

- Understand the water cycle.
    - Why it's bad: Too vague. What does "understand" mean? It's not measurable.
- Learn about cell structure.
    - Why it's bad: Also vague. "Learn" is not specific or measurable. What level of learning is expected?
- Appreciate the importance of history.
    - Why it's bad: "Appreciate" is subjective and not measurable. How do you measure appreciation?
- Know about plants.
    - Why it's bad: Very broad and unspecific. What aspects of plants? What level of knowledge?
- Be familiar with social media.
    - Why it's bad: "Familiar" is vague. What level of familiarity? What specific aspects of social media?

Good Examples

- Describe the three main stages of the water cycle.
    - Why it's good: Specific, measurable (can the student describe them?), and achievable.
- Label the parts of an animal cell diagram.
    - Why it's good: Clear action (label), measurable (can they label correctly?), and achievable.
- Explain two causes of the French Revolution.
    - Why it's good: Specific action (explain), measurable (can they explain two causes?), and achievable.
- List five characteristics of a desert plant.
    - Why it's good: Clear action (list), measurable (can they list five?), and achievable.
- Compare and contrast two social media platforms in terms of user demographics.
    - Why it's good: Specific actions (compare and contrast), measurable (can they do so accurately?), and achievable.

Tips

- Use Action Verbs (Bloom's Taxonomy): Start with verbs that describe observable actions (e.g., describe, label, explain, list, compare).
- Be Specific: Clearly state what the student should be able to do.
- Make it Measurable: Ensure the objective can be assessed or evaluated.
- Keep it Achievable: Set realistic expectations for what students can accomplish within the learning period.

Time Frame	Course Outcomes	Specific Learning Outcomes
MID-TERM	**Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science	**Explain** the key characteristics and principles that define the nature, goal, scope of science and the domains of learning in the context of science education. **Summarize** standards and the scope of science. **Compare and contrast** the conceptual underpinning of the teaching of science in K to 12

		Curriculum through Graphic organizer.
	Construct effective assessment tools in teaching science	**Discuss** the varied types and modes of assessment. **Critique** sample test items and rubrics, identifying strengths and areas of improvement. **Develop** traditional and authentic assessments tools that align with the objectives of science education in K to 12.
MIDTERM EXAMINATION		
FINAL TERM	**Design** an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities	**Discuss** the different phases in lesson planning preparation. **Analyze** the alignment of the learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities utilized by a resource teacher during a class observation. **Design** an engaging and inquiry-based science lessons that promote critical thinking, problem-solving, and scientific inquiry.
	Demonstrate pedagogical and technological knowledge and skills in the teaching of science	**Assess** various educational technology tools suitable for science instruction. **Integrate** technology in employing varied pedagogies in the teaching of science. **Execute** teaching by integrating technology in employing varied pedagogies in the teaching of science.
FINALTERM EXAMINATION		

STEP 3: DETERMINE ASSESSMENT METHODS

- How will student learning be assessed? (Exams, quizzes, papers, projects, participation)

Direct Alignment

- ☐ The assessment should directly reflect the skills or knowledge stated in the course outcome.
- ☐ If the course outcome states "Design an instructional plan," then a compatible assessment would be an "Instructional Plan of a chosen topic in Science."

Measurability

- ☐ The assessment should be something that can be objectively measured or evaluated.
- ☐ It should produce a tangible piece of work or a demonstrable skill that can be assessed against clear criteria.

Demonstration of Skills

- ☐ The assessment should require students to actively demonstrate the skills or knowledge outlined in the course outcome, not just recall information.
- ☐ It should involve application, creation, or analysis.

Level of Cognitive Complexity

- ☐ The cognitive level required for the assessment should match or be slightly higher than the cognitive level of the course outcome.
- ☐ If a course outcome requires "Applying" knowledge, the assessment should require applying that knowledge in a practical way.

Evidence of Learning

- ☐ The assessment should provide clear evidence that the student has achieved the specific learning outcomes that support the course outcome.
- ☐ It should show that the student has understood, applied, and potentially analyzed or created something related to the course content.

Incompatible Assessments

- ☐ Simple recall tests when the course outcome requires higher-order thinking skills.
- ☐ Vague or subjective tasks that don't provide clear evidence of learning.
- ☐ Tasks that don't directly relate to the stated course outcomes.

Time Frame	Course Outcomes	Performance Assessment Outputs
MID-TERM	**Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science	Graphic Organizer
	Construct effective assessment tools in teaching science	Unit/Chapter Test Tests and Rubrics
MIDTERM EXAMINATION		
FINAL TERM	**Design** an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities	Instructional Plan of a chosen topic in Science
	Demonstrate pedagogical and technological knowledge and skills in the teaching of science	Teaching Demonstration
FINALTERM EXAMINATION		

STEP 4: SET TEACHING APPROACH AND STRATEGY

- Select the teaching approach and strategies that will be employed in the course.
- Ensure alignment with the learning objectives and assessment methods.

Alignment with Learning Objectives

- ☐ Do your chosen methods directly support the achievement of your specific learning outcomes and course outcomes?
- ☐ Are your strategies designed to help students acquire the knowledge and skills you intend for them to learn?

Student Engagement

- ☐ Are students actively participating in class activities and discussions?
- ☐ Do students seem interested and motivated by the teaching methods?

- [ ] Are students asking questions and seeking clarification, indicating they are thinking critically?

Assessment Results

- [ ] Do student assessments (exams, projects, etc.) demonstrate that they are meeting the learning objectives?
- [ ] Are students able to apply what they've learned in practical ways?
- [ ] Do the assessment outcomes align with what you intended for students to achieve?

Variety and Flexibility

- [ ] Are you using a range of teaching methods to cater to different learning styles?
- [ ] Are you able to adapt your approach if something isn't working or if students are struggling?
- [ ] Are you willing to try new strategies and techniques to keep things fresh and engaging?

Feedback and Reflection

- [ ] Are you seeking feedback from students about their learning experience?
- [ ] Are you reflecting on your teaching practices and identifying areas for improvement?
- [ ] Are you open to making changes based on student feedback and self-reflection?

Resource Availability

- [ ] Do you have the necessary resources (technology, materials, etc.) to effectively implement your chosen strategies?
- [ ] Are you able to manage time effectively and cover the required content within the allocated time frame?

Context and Environment

- [ ] Does your approach suit the specific context of your classroom (class size, student demographics, etc.)?
- [ ] Does it align with the overall educational philosophy and policies of your institution?

Overall Effectiveness

- [ ] Are students demonstrating a clear understanding of the material?

- ☐ Are they developing the skills and competencies you intended?
- ☐ Are you, as the instructor, satisfied with the learning outcomes and student progress?

Time Frame	Course Outcomes	Innovative Approaches and Strategies
MID-TERM	**Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science	Brain-based learning Interactive Discussion Collaborative Learning Multimedia Presentations
	Construct effective assessment tools in teaching science	Think-Pair -Share Critiquing Sessions Interactive Discussion Multimedia Presentations
MIDTERM EXAMINATION		
FINAL TERM	**Design** an instructional plan indicating learning outcomes, methods and strategies, assessment tools, instructional materials and teaching and learning activities	Interactive Discussion Critiquing Collaborative Learning Differentiated Instruction Multimedia Presentations
	Demonstrate pedagogical and technological knowledge and skills in the teaching of science	Critiquing Sessions Group Discussions Multimedia Presentations Interactive Discussion Differentiated

		Instruction
FINALTERM EXAMINATION		

STEP 5: LIST ICT TOOLS/RESOURCES

Alignment with Learning Objectives

- ☐ Does the tool support the specific learning outcomes and course outcomes?
- ☐ Will it help students achieve the intended knowledge or skills?

Suitability for Teaching Strategy

- ☐ Does the tool complement the chosen teaching approach and strategy (e.g., constructivist, collaborative)?
- ☐ Will it enhance or facilitate the planned activities?

Student Accessibility and Familiarity

- ☐ Is the tool accessible to all students?
- ☐ Are they familiar with it, or will training be needed?
- ☐ Consider internet access, device compatibility, and digital literacy levels.

Ease of Use

- ☐ Is the tool user-friendly for both the instructor and students?
- ☐ Is it easy to learn and navigate, or will it require extensive technical support?

Technical Requirements

- ☐ Does the tool require specific hardware or software?
- ☐ Are there any technical limitations or potential issues that could disrupt the learning process?

Cost and Availability

- ☐ Is the tool free or does it require a subscription or purchase?
- ☐ Is it readily available or will it take time to acquire and implement?

Integration with Existing Systems

- ☐ Can the tool integrate with existing learning management systems (LMS) or other platforms?
- ☐ Will it streamline workflows or create additional complexity?

Privacy and Security

- ☐ Does the tool comply with privacy regulations and data security standards?
- ☐ Will it protect student information and ensure a safe online environment?

Engagement and Motivation

- ☐ Will the tool enhance student engagement and motivation?
- ☐ Does it offer interactive features, multimedia content, or gamification elements?

Assessment and Feedback

- ☐ Does the tool support assessment and feedback processes?
- ☐ Can it track student progress, provide analytics, or facilitate timely feedback?

Reliability and Support

- ☐ Is the tool reliable and stable?
- ☐ Is there adequate technical support available if issues arise?

Flexibility and Adaptability

- ☐ Can the tool be adapted to different learning styles and needs?
- ☐ Is it flexible enough to accommodate changes in the course or curriculum?

Time Frame	Course Outcomes	ICT Tools /Resources
MID-TERM	**Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science	Google Classroom and other collaboration and productivity tools Microsoft Office Suite and other educational software and tools Projecting Digital Devices
	Construct effective assessment tools in teaching science	Google Classroom and other collaboration and productivity tools Microsoft Office Suite and other educational software and tools Projecting Digital Devices
MIDTERM EXAMINATION		
FINAL TERM	**Design** an instructional plan indicating learning outcomes, methods and strategies,	Google Classroom and other collaboration and productivity tools

	assessment tools, instructional materials and teaching and learning activities	Microsoft Office Suite and other educational software and tools Projecting Digital Devices
	Demonstrate pedagogical and technological knowledge and skills in the teaching of science	Google Classroom and other collaboration and productivity tools Microsoft Office Suite and other educational software and tools Projecting Digital Devices
FINALTERM EXAMINATION		

STEP 6: LIST REQUIRED MATERIALS

- List textbooks, readings, software, or other materials students need.
- Provide information on where to obtain these materials.

Alignment with Course Objectives

- ☐ Does each reading directly support the learning objectives and course outcomes?
- ☐ Does the material provide the necessary knowledge or skills that students are expected to acquire?

Relevance to Content

- ☐ Is the reading material current, accurate, and relevant to the course content?
- ☐ Does it cover essential topics and provide depth or breadth of understanding?

Level of Difficulty

- ☐ Is the reading material appropriate for the students' level of understanding and prior knowledge?
- ☐ Is it challenging enough to promote learning, but not so difficult that it becomes overwhelming?

Quantity and Length

- ☐ Is the amount of reading manageable within the course timeframe?
- ☐ Is the length of each reading appropriate, or are there excessively long or short readings?

Variety of Sources

- ☐ Do the readings represent a variety of perspectives, authors, and sources?
- ☐ Are there different types of materials, such as articles, books, reports, or primary sources?

Accessibility and Availability

- ☐ Are the readings easily accessible to students (e.g., library resources, online availability)?
- ☐ Are there any cost implications for students in accessing the materials?

Engagement and Interest

- ☐ Are the readings likely to be engaging and interesting for students?
- ☐ Do they stimulate critical thinking and discussion?

Integration with Assessments

- ☐ Do the readings provide the basis for assignments, discussions, or exams?
- ☐ Are students expected to demonstrate their understanding of the readings in their assessments?

Review and Feedback

- ☐ Have you reviewed the readings yourself to ensure their suitability?
- ☐ Have you sought feedback from colleagues or previous students on the selected materials?

Time Frame	Course Outcomes	Required Readings
MID-TERM	**Demonstrate** content knowledge of science in the K to 12 curriculum including its nature, content, domains of learning, and conceptual framework of the teaching of science	Conception, B. et al. (2010). Licensure Examination for Teachers. MET Review Center, Sampaloc, Manila. Corpuz, B. et al. (2015). Principles of Teaching 2. Lorimar Publishing, Inc. Manila, Philippines. Khery, Y. et al. FINALTERM EXAMINATION		

STEP 7: REVIEW AND REVISE

- Review the syllabus for clarity, consistency, and accuracy.
- Get feedback from colleagues or other instructors.
- Make revisions as needed before distributing to students.

Review for Clarity

- ☐ Language: Is the language clear and concise? Avoid jargon or overly technical terms that students might not understand. Use simple, direct sentences.
- ☐ Organization: Is the information organized logically? Does the flow of the syllabus make sense?

- [ ] Policies: Are course policies clearly stated and easy to understand?

Review for Consistency

- [ ] Formatting: Is the formatting consistent throughout the document? Are fonts, spacing, and headings uniform?
- [ ] Terminology: Is the same terminology used consistently? Avoid using different terms to refer to the same thing.
- [ ] Tone: Is the tone of the syllabus consistent? Is it professional, welcoming, and supportive?

Review for Accuracy

- [ ] Resources: Are links to online resources, readings, and websites working correctly?
- [ ] Policies: Are all outcomes aligned with institutional guidelines and regulations?

Get Feedback from Colleagues or Other Instructors

- [ ] Peer Review: Share your syllabus with colleagues or other instructors who have taught similar courses. Ask for their feedback on clarity, content, and organization.
- [ ] Different Perspectives: Getting feedback from others can provide different perspectives and help identify areas that you might have overlooked.
- [ ] Constructive Criticism: Be open to constructive criticism and consider all feedback carefully.

Make Revisions as Needed

- [ ] Address Feedback: Address the feedback you receive from colleagues and make revisions as needed.
- [ ] Multiple Revisions: It's common to go through several rounds of revisions before finalizing the syllabus.
- [ ] Final Check: After making revisions, do a final check to ensure that everything is accurate and consistent.

Ongoing Review and Adaptation

- [ ] Stay Flexible: Be prepared to make adjustments to the syllabus during the semester if needed.
- [ ] Reflect and Improve: After the course is over, reflect on the effectiveness of the syllabus and make improvements for future semesters.

STEP 8: BE FLEXIBLE AND ADAPTABLE

- Be prepared to make adjustments to the syllabus as needed during the semester.
- Communicate any changes to students clearly and promptly.

Anticipate the Need for Changes

- Recognize that unforeseen circumstances (e.g., technical issues, student difficulties, unexpected events) may necessitate changes to the syllabus.
- Be open to the possibility that your initial plan may need modifications based on how the course progresses.

Respond to Student Needs

- Pay attention to student feedback and concerns. If students are struggling with a particular topic or assessment method, be prepared to adjust your approach.
- Be willing to provide additional support or resources to students who need it.
- Consider offering alternative assignments or assessment formats if appropriate.

Adapt to Unexpected Circumstances

- Be prepared to adjust the syllabus in response to unexpected events (e.g., weather closures, instructor illness, changes in institutional policies).
- Have a backup plan in case technology fails or other resources are unavailable.

Communicate Changes Clearly

- If changes to the syllabus are necessary, communicate them to students clearly and promptly.
- Provide written updates or announcements in addition to verbal communication.
- Ensure that all students are aware of the changes and have access to the revised syllabus.

Maintain Open Communication

- Encourage students to share their feedback and concerns throughout the course.
- Be responsive to student questions and suggestions.
- Create a classroom environment where students feel comfortable expressing their needs.

Reflect and Learn

- After making changes to the syllabus, reflect on their effectiveness.
- Consider what worked well and what could be improved in the future.
- Use your experiences to refine your syllabus design and teaching practices.

Balance Flexibility with Structure

- While it's important to be adaptable, it's also essential to maintain a clear structure and expectations for the course.
- Avoid making frequent or arbitrary changes that could confuse or overwhelm students.
- Ensure that any changes you make are fair and consistent for all students.

Document Changes

- Keep a record of any changes you make to the syllabus and the reasons for those changes.
- This documentation can be helpful for future course planning and review.
